With the recent series of natural disasters,
what happens if there is no internet access to
your medical records?

What if the world's disaster relief agencies (like FEMA)
had access to emergency medical records and relocation
information on their laptop?

LifeSaverGroup makes sure they can!

www.911disasterplan.com

- FEMA estimated that over one million people were displaced from their communities during Hurricane Katrina, including 200,000 people on Medicare.
- Over 1.8 million people are in nursing homes.
- There were 100's of hospitals & nursing homes in the path of Hurricane Irene.
- Emergency response teams (FEMA) are "after the fact" with no pre-planning

911DisasterPlan™ is an online system to track vulnerable citizens who are displaced during a natural or manmade disaster. When a hurricane or forest fire approaches a community, mandatory evacuation would probably be ordered. A mandatory evacuation works great for those individuals who are ambulatory and who understand the need for evacuation. What happens to the people in your community that are in wheelchairs or bedridden, people with special needs such as the mentally ill, mentally handicapped, dependent on oxygen, dialysis, or other medical equipment? **911DisasterPlan™** identifies the vulnerable individuals in your community so that an orderly evacuation plan can be devised. **911DisasterPlan™** also creates comprehensive reports that identify the individuals within each category and all of their demographic information. You can use the summary report to look at the community as a whole, or use the detailed report for information about each individual within the community. During an actual evacuation, **911DisasterPlan™** tracks where individuals are relocated, while also having an ongoing report that gets updated periodically to track the relocation and subsequent return progress.
